

Ingineria Programării în Rețea (IPR)

Unelte software utile în
proiectarea și implementarea unei
aplicații de rețea

Ping

- Instrumentul cel mai popular pentru testarea conectivității într-o rețea IP
- Disponibil pe majoritatea sistemelor de operare
- Codul sursa:
<http://ftp.arl.army.mil/pub/misc/ping.shar>
- Sintaxa:
`ping -arg. adresaIP(sau hostname)`

Ping – funcționare

- Calculatorul sursă trimite pachete de tip ICMP “echo request” către destinație și așteaptă răspunsuri ICMP “echo response”
- La final se calculează statistici privind:
nr. de pachete trimise/recepționate,
timpul de round trip (min, media, max, mdev)

Ping – example (1)

```
linux-413h:~ # ping 192.168.34.7
PING 192.168.34.7 (192.168.34.7) 56(84) bytes of data.
64 bytes from 192.168.34.7: icmp_seq=1 ttl=64 time=0.367 ms
64 bytes from 192.168.34.7: icmp_seq=2 ttl=64 time=0.991 ms
64 bytes from 192.168.34.7: icmp_seq=3 ttl=64 time=0.312 ms
64 bytes from 192.168.34.7: icmp_seq=4 ttl=64 time=0.319 ms
64 bytes from 192.168.34.7: icmp_seq=5 ttl=64 time=0.467 ms
64 bytes from 192.168.34.7: icmp_seq=6 ttl=64 time=0.393 ms
64 bytes from 192.168.34.7: icmp_seq=7 ttl=64 time=0.343 ms

--- 192.168.34.7 ping statistics ---
7 packets transmitted, 7 received, 0% packet loss, time
 6001ms
rtt min/avg/max/mdev = 0.312/0.456/0.991/0.223 ms
```

Ping – example (2)

```
C:\Documents and Settings\rolv00r7>ping www.ietf.org
```

```
Pinging a165.g.akamai.net [88.221.26.88] with 32  
bytes of data:
```

```
Reply from 88.221.26.88: bytes=32 time=44ms TTL=56
```

```
Reply from 88.221.26.88: bytes=32 time=43ms TTL=56
```

```
Reply from 88.221.26.88: bytes=32 time=42ms TTL=56
```

```
Reply from 88.221.26.88: bytes=32 time=43ms TTL=56
```

```
Ping statistics for 88.221.26.88:
```

```
    Packets: Sent = 4, Received = 4, Lost = 0 (0%  
    loss),
```

```
Approximate round trip times in milli-seconds:
```

```
    Minimum = 42ms, Maximum = 44ms, Average = 43ms
```

Ping – protocolul ICMP

■ Mesajul de "echo request" – type 8

00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Type = 8								Code = 0								Header Checksum															
Identifier																Sequence Number															
Data ...																															

■ Mesajul de "echo reply" – type 0

00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Type = 0								Code = 0								Header Checksum															
Identifier																Sequence Number															
Data ...																															

Ping – 4 pași pentru testarea unei conexiuni

1. `ping 127.0.0.1` – testarea interfeței de loopback (verificăm că protocolul TCP/IP e instalat)
2. `ping adresa_IP_locala` – testarea interfeței de rețea locală
3. `ping adresa_IP_gateway_default` – testarea conectivității către exterior
4. `ping adresa_IP_destinație` – testare conectivitate cu echipamentul destinație

Ping – TTL (TimeToLeave)

- TTL = nr. max. de routere prin care pachetul poate trece înainte de a fi aruncat; fiecare router decrementează acest câmp cu o unitate

TTL exemplu

■ Aflăm TTL-ul mașinii locale:

```
Reply from 127.0.0.1: bytes=32 time<1ms TTL=128
```

```
Reply from 127.0.0.1: bytes=32 time<1ms TTL=128
```

■ Ping către mașina locală:

```
PING 79.116.226.134 (79.116.226.134) 56(84) bytes of data.
```

```
64 bytes from 79.116.226.134: icmp_seq=1 ttl=120 time=21.7 ms
```

```
64 bytes from 79.116.226.134: icmp_seq=2 ttl=120 time=5.48 ms
```

TTL exemplu (continuare)

■ Verificare TTL:

Tracing route to sg5.gazduire.ro [80.96.148.28]
over a maximum of 30 hops:

1	2 ms	1 ms	1 ms	nas-pppoe-bartolomeu2.brasov.rdsnet.ro [86.125.87.71]

3	2 ms	2 ms	2 ms	213-154-120-221.rdsnet.ro [213.154.120.221]
4	2 ms	2 ms	2 ms	213-154-120-161.rdsnet.ro [213.154.120.161]
5	4 ms	5 ms	5 ms	213-154-124-105.rdsnet.ro [213.154.124.105]
6	5 ms	27 ms	5 ms	qr04.bucuresti.rdsnet.ro [213.154.97.2]
7	5 ms	5 ms	5 ms	82-76-244-98.rdsnet.ro [82.76.244.98]
8	5 ms	7 ms	5 ms	c3560-v02.gazduire.ro [217.156.103.242]
9	5 ms	5 ms	5 ms	sg5.gazduire.ro [80.96.148.28]

Trace complete.

■ **8 (=128-120)** routere (noduri) între
sursă și destinație

Atacuri folosind ping

- Ping of death:

- atacul e bazat pe pachete ICMP fragmentate (RFC 791 nu permite pachete mai mari de 65,535 bytes)
- la destinație pachetul este reasamblat și poate genera un buffer overflow, urmat de crash-ul sistemului

- Ping flood:

- un atac simplu de tip DOS (Denial Of Service)
- reușește dacă banda atacatorului este mai mare decât banda victimei

Ping și securitatea

- Multe firewall-uri din ziua de azi fac calculatoarele “invizibile” (nu răspund la ping)
- Unii provideri de Internet filtrează prin routerele lor mesajele de tip ICMP, pentru a opri un eventual atac cu ping

Ping din Internet

- Câteva site-uri de unde puteți da ping din Internet:

<http://www.pingme.ro/>

<http://www.eckes.org/modules.php?name=Content&pa=showpage&pid=2>

Traceroute

- Utilitar care permite vizualizarea rutei de la sursă la destinație (nivelul 3)
- Sintaxa:

```
traceroute -arg. adresaIP (sau  
hostname)
```

Sau, pentru Windows:

```
tracert -arg. adresaIP (sau  
hostname)
```

Traceroute – exemple (1)

Tracing route to google.com [72.14.207.99]
over a maximum of 30 hops:

1	11 ms	15 ms	15 ms	nas-pppoe-bartolomeu2.brasov.rdsnet.ro [86.125.87.71]
2	15 ms	15 ms	15 ms	dr05.brasov.rdsnet.ro [86.125.87.65]
3	15 ms	15 ms	15 ms	213-154-120-221.rdsnet.ro [213.154.120.221]
4	15 ms	15 ms	15 ms	213-154-120-161.rdsnet.ro [213.154.120.161]

14	124 ms	124 ms	124 ms	eh-in-f99.google.com [72.14.207.99]

Trace complete.

Traceroute – exemple (2)

```
traceroute to cern.ch (137.138.28.241), 40 hops max, 40 byte packets
```

```
1  129.194.9.1    0.506 ms   0.370 ms   0.310 ms
2  192.33.214.3   0.544 ms   0.532 ms   0.533 ms
3  130.59.36.121  0.748 ms   0.645 ms   0.646 ms
4  130.59.36.141  0.869 ms   0.808 ms   0.749 ms
5  130.59.36.209  0.784 ms   0.765 ms   0.756 ms
6  192.65.184.222 0.838 ms   0.793 ms   0.784 ms
7  * * *
8  * * *
9  * * *
10 * * *
11 137.138.28.241 1.675 ms   1.469 ms   1.437 ms
```

Traceroute - utilizare

- Cu traceroute se pot identifica rutele congestionate
- Se poate determina cel mai rapid mirror pentru download

Traceroute - securitate

- Unele routere/noduri își “ascund” identitatea pentru a oferi protecție
- Unii atacatori au folosit traceroute pentru a avea o imagine asupra arhitecturii unei rețele

Tcpdump

tcpdump/libpcap

- Utilitar destinat monitorizării traficului în rețea și achiziționării de date.
- Plăcile de rețea Ethernet capturează la nivelul data-link doar pachetele destinate lor sau cele de broadcast. Pentru a captura toate frame-urile tcpdump trece interfața într-un mod special de lucru, numit promiscuous.

Tcpdump - utilizare

- Sintaxa: `tcpdump -arg.`
- Exemple de argumente:
 - `-i eth0` capturează doar pe interfața `eth0`
 - `-c21` se oprește după 21 packete
 -

Tcpdump – exemple (1)

```
07:39:05.839538 IP 192.168.34.1 > linux: ICMP echo request, id 512, seq 7680,

```

Tcpdump explicații

- **07:39:15.954542** – Timpul în care pachetul TCP a intrat în rețeaua locală
- **IP** – tip pachet
- **192.168.34.1.4788** – adresa și portul sursă
- **linux.ssh** – destinația și portul destinație
- **P 1:45(44) ack 21 win 65515** – proprietăți tcp: intervalul numerelor de secvență, urmat de nr. de octeți din interval, dimensiunea ferestrei pe care sursa e capabilă să o accepte

Wireshark

- Cel mai popular analizor de rețea
- Cunoscut inițial sub numele de Ethereal
- Similar cu tcpdump, diferența majoră o reprezintă GUI-ul

Wireshark – features

- Suportă 935 de protocoale
- Pachetele pot fi capturate din medii ca Ethernet, FDDI (Fiber Distributed Data Interface), PPP (Point to Point Protocol), Token Ring, IEEE802.11, Loopback
- Permite definirea de filtre

Wireshark – filtre

■ Operatori de comparare suportați:

- ==
- !=
- >
- <
- <=
- >=

Wireshark – filtre

■ Operații logice

- & &
- | |
- ^ ^
- !

Wireshark – exemple aplicare filtre

- `dns || icmp`
- `ip.addr == 10.10.1.1`
- `ip.src != 10.1.2.3 and ip.dst != 10.4.5.6`
- `tcp.port == 21`
- `tcp.dstport == 23`
- `tcp.flags`
- `tcp.flags.syn == 0x02`

Wireshark – exemple (1)

File Transfer Protocol (FTP) (ftp), 22 bytes

Packets: 76 Dis

Iptraf

- Utilitar de consolă pentru Linux
- Oferă statistici privind interfețele de rețea: traficul in și out (în kbits/sec și pachete/sec), traficul total pe o interfață
- Statistici în funcție de tipul pachelor: IP, Non-IP
- Trafic detaliat în funcție de protocol: TCP, UDP, ICMP, Other IP

Iptraf

- Suportă Ethernet, FDDI, ISDN, SLIP, PPP și Loopback
- Sunt suportate majoritatea plăcilor de rețea deoarece este folosită interfața de tip raw socket a kernelului Linux
- Logging
- Un modul de statistică pe întregul LAN

Iptraf – exemplu
